Examination and synthesis of the 176-page master

Bottom line. The 46 new pages hold up. Their numbers reproduce on Kraken, their method reviews are correct, and their indicator research reaches the same verdict as a separate four-agent study run on 23–24 Oct: almost nothing outside price momentum has tested power to call BTC direction days to weeks ahead, but several inputs reliably flag risk regimes. The two efforts are complementary, and together they define six bounded experiments. Three conflicts need the owner: the fee tier, the GRAM listing, and how basket calls are attributed.

New section (pages)	What it says	Verdict
Research-process audit (1–5)	Recovers 6 omitted sources; adds a source-disposition rule; queues HY-spread momentum and downside-risk targeting as challengers	Sound. Adopt the disposition rule.
Allocation redesign review (6–14)	Reported PBO 57%, DSR 0.33 and replay table are unverified; corrects KAMA, liquidity identity, HRP, labels, CPCV	Sound. Spot-checked: break-even 52.67%, KAMA SC 0.0601 at ER 0.30, CPCV 15 splits / 5 paths all correct.
Missing predictors (15–35)	Ranks BTC-equity correlation change and derivatives stress first; Kalshi macro repricing predicts volatility; 16 endpoint checks	Agrees with the independent study; adds two citations it lacked (Yae & Tian 2022; Mohanty & Krishnamachari 2026).
Oct 23 scorecard (36–37)	Oct 22 firm group beat weak group at 24h (PASS, Brier 0.2025); two new 60% calls to Oct 24 17:00 UTC	Reproduced exactly: firm −0.010%, weak −1.174%, BTC +0.004%. New calls open.
Oct 18 leaders (38)	ZEC +10.8%, INJ +8.3%, ZRO +7.7%, UNI +6.6% in 6h from depressed range positions	Consistent with the verification chapter.
Oct 22 resilience study (39–44)	Separates retained gains from current downside defense; frozen 24h test	Consistent with Claude's Oct 22–23 rankings; adds useful thin-market flags.
Market-watch addendum (175–176)	Oct 8–22 level map and ETF-flow chronology	Historical context; ETF figures match other reports.

Method: every new page read in full; claimed figures re-derived from public Kraken 15-minute candles on 24 Oct 01:34 UTC; formula examples recomputed. No production code, settings or orders were touched.

1 | Conflicts and corrections

Issue	Finding	Action
Kraken fee tier	The new chapter (p. 30) uses the owner-reported 0.20% maker / 0.38% taker. On 22 Oct the owner confirmed the app's tier-1 default, 0.40% / 0.80%. Research studies used 0.40% round trip (0.20% per side).	Owner to confirm one tier. If 0.20/0.38 is right, set ZOBIRIS_KRAKEN_FEE_TIER=4 (0.20/0.35) or add the exact schedule.
GRAM on Kraken	Claude reported GRAM unavailable on Kraken. The new chapter is right: GRAM is the former Toncoin and trades as TON/USD.	Corrected. Map GRAM to TONUSD in the call log and monitors.
Basket-call attribution	The other model's 22 Oct firm-vs-weak call (55%, 24h) is its own. Separately, the call logged as the owner's 72h basket (65%) used a probability Claude suggested and the owner accepted.	Both stand as logged; the 65% record now notes its origin. Score owner-originated probabilities separately from accepted suggestions.
Floor calls	The other model's 60% floor call covers 24h; Claude's and the owner's run to 29 Oct. Different questions.	Score each on its own window. No merging.
Deploy status	Cost-schedule fix merged to main (0c9cb4f) on 22 Oct with CI green, but Railway had not redeployed.	Owner to trigger a deploy in the Railway dashboard.

2 | Combined indicator ranking

Both studies converge. The benchmark every new input must beat is plain momentum (price versus its 50-day average): Liu & Tsyvinski (RFS 2021) find a one-standard-deviation weekly return predicts +3.16% next week, and BGeometrics' Oct 2026 holdout found most on-chain rules no better than a 50-day filter.

#	Input	Role	Best evidence	Free source
1	BTC–equity correlation change	Direction candidate	Yae & Tian (Physica A 2022): best daily OOS predictor, R^2 2.69%. Correlation swung −0.68 to +0.74 in 2026.	Kraken + FRED/Yahoo
2	Futures carry (basis)	Crash-risk flag	BIS WP 1087 (2023): high carry predicts crashes	Deribit, OKX, CME settlements
3	Derivatives stress pack: quantity OI, funding extremes, ATM IV, skew	Risk / volatility	Funding extremes ±1.8%/24h, regime-dependent (SSRN 2026); OI must be converted to coin units	OKX, Deribit, Hyperliquid
4	Implied vs realized vol (DVOL − RV)	Regime flag	DVOL above next-30d realized vol on 73.7% of days; DVOL 37.3 on 19 Oct, lowest since 2021	Deribit
5	Kalshi macro repricing	Volatility forecast	Mohanty & Krishnamachari (2026 preprint): recession-risk repricing cuts BTC vol forecast error 2.1% (MSFE 0.979)	Kalshi, Polymarket
6	Token-unlock calendar	Alt demote flag	Keyrock (16,000 events): 90% negative, pressure starts ~30 days before; large unlocks about −15%	Tokenomist, CryptoRank
7	Coinbase premium; Korea premium	Direction candidate (untested)	Mechanism documented (Makarov & Schoar, JFE 2020); no forecasting test found. Coinbase premium negative 20 straight days to 13 Oct	Coinbase, Upbit + FX
8	Fed/CPI/payroll surprise (not level)	Event risk	NY Fed SR 1052: BTC mostly ignores macro news except CPI	BLS, FRED/ALFRED
9	Stablecoin supply and exchange inflows	Confirm only	Supply follows price (Wei 2018); USDT exchange inflows predict BTC at 1–2h only (2025)	DeFiLlama
10	MVRV, realized price, cost bases	Cycle context	Cycle valuation only; MVRV 1.50 (realized price ~$54k); ETF cost basis ~$81.5k; 2-yr buyers above ~$88k	Coin Metrics community

Skip or use as negative controls: the global-M2 "10–12 week lead" (lags fitted after the fact), hash ribbons, max pain, CME gap fills, liquidation-map "magnets" (cascades are real; attraction is unproven), lunar cycles, Fear & Greed as a contrarian signal (it leans momentum and fails OOS), LLM news sentiment, whale alerts.

3 | Market record, 22–24 October

Driver	Reading	Bearing on open calls
BTC	$81.4–81.7k; Oct 15 floor $79,709 held twice; 24h low since Oct 23 17:00 UTC $80,418	Floor intact so far
Stocks	Nasdaq −2.58% on 22 Oct (AI doubts: AMD −8%, Micron −6%, Nvidia −4%); S&P −1.19%; Brent $116.7	Base rate: after a Nasdaq −2.5% close, BTC traded 5%+ lower within 7 days 59% of the time vs 42% normally (n=37)
Fed and jobs	Hold expected 27–28 Oct, December hike priced; hot Sep CPI; Sep payrolls +29k vs ~84k expected, unemployment 4.2%	Stagflation mix: a headwind for risk assets
Flows	Spot ETFs +$526.6M on 19 Oct (IBIT +$665M) after −$910M over two weeks; Strategy bought only 267 BTC; corporate net buying fell to 5.6k BTC in Q3	ETFs, not Strategy, are the marginal buyer
Liquidations (Hyperliquid)	$621M of longs vs $147M of shorts within ±10%; ~$175M of long liquidations at $79.3–80.3k; largest cluster $99M at $74.4–74.9k; Apex tier net short	A floor break could cascade toward $77k
Prediction markets	Polymarket: dip to $80k by 25 Oct 25.5%; to $77.5k in October 30.5%; above $80k on 29 Oct 69%. Kalshi: above $79.5k at 30 Oct ~73%	Crowd puts the floor holding at ~60–65%
Supply events	MSCI rule for Strategy 30 Nov; Nakamoto–Kraken loan due December; MARA sending 500-BTC batches; Mt. Gox ~34k BTC deferred to Oct 2027	Calendar flags, mostly priced in
Leaders since 18 Oct low	CVX +30, COMP +17, DASH +16, ZEC +15 vs BTC; TIA −7, STX −7, SAND −6	Leaders held at the bottom on 1.7× volume vs 1.0× for laggards

4 | Forecast ledger

Forecaster	Call	p	Resolves	Status
Other model	Oct 22 firm group beats weak group, 24h	0.55	23 Oct 16:00	PASS (verified), Brier 0.2025
Other model	BTC holds $79,700, 24h	0.60	24 Oct 17:00	Open; low $80,418 so far
Other model	UNI, ZEC, SOL beat HBAR, AVAX, TIA, 24h	0.60	24 Oct 17:00	Open; −3.73% vs −1.73% so far
Owner (p suggested by Claude)	11 firm coins beat 7 weak coins, 72h	0.65	25 Oct 13:52	Open
Claude	Same baskets, from 23 Oct	0.55	25 Oct 13:25	Open
Owner	BTC holds $79,709 through 29 Oct	0.85	29 Oct 23:38	Open
Claude	Same; original / updated after macro data	0.45 / 0.35	29 Oct 23:25 / 23:47	Open
Claude	CVX, COMP, DASH, ZEC beat BTC, 7 days	0.45	30 Oct 16:25	Open
Claude (scored)	Oct 21 rotation buckets; TIA breakout	0.45; 0.30	22 Oct	Both missed as leaned; Brier 0.20, 0.09

5 | Merged experiment plan

Fix data first, then test one challenger at a time against the momentum benchmark, with Kraken costs and a locked chronological holdout. Register each test before outcomes; keep every null result.

#	Experiment	Target and pass rule	Source
0	Data contract and fee tier	Every observation timestamped by first availability; one confirmed fee schedule; GRAM→TON mapping	Both
A	BTC–equity correlation change	Next-day BTC return; OOS error below zero and expanding-mean forecasts after momentum controls	Other model

#	Experiment	Target and pass rule	Source
B	Derivatives stress + carry + DVOL−RV	1h/24h volatility and tail events; calibrated tail probabilities beat a realized-vol (HAR) baseline	Both
C	Kalshi macro repricing	Next-day realized vol; replicate MSFE < 1 including the failed Fed result	Other model
D	Token-unlock demote flag	Alt 30-day excess vs BTC for coins with large unlocks ahead vs matched coins without	Claude
E	Coinbase premium	Next 1–7 day BTC return; must add beyond ETF flows	Claude
F	Volume at the BTC turn (registered 23 Oct)	Top-third vs bottom-third relative volume at the turn, 72h excess vs BTC, after 6 turns	Claude
G	Post-drop relative strength (registered 22 Oct)	Least- vs most-fallen fifth, 72h, after 10 drops; daily monitor live	Claude

Not doing: a simultaneous v4 overhaul; promoting any reported-but-unreproduced PBO/DSR figure; replacing risk caps with HRP; treating liquidation clusters as targets.
